# Data Mesh

# Architettura Data Infrastructure as a Service

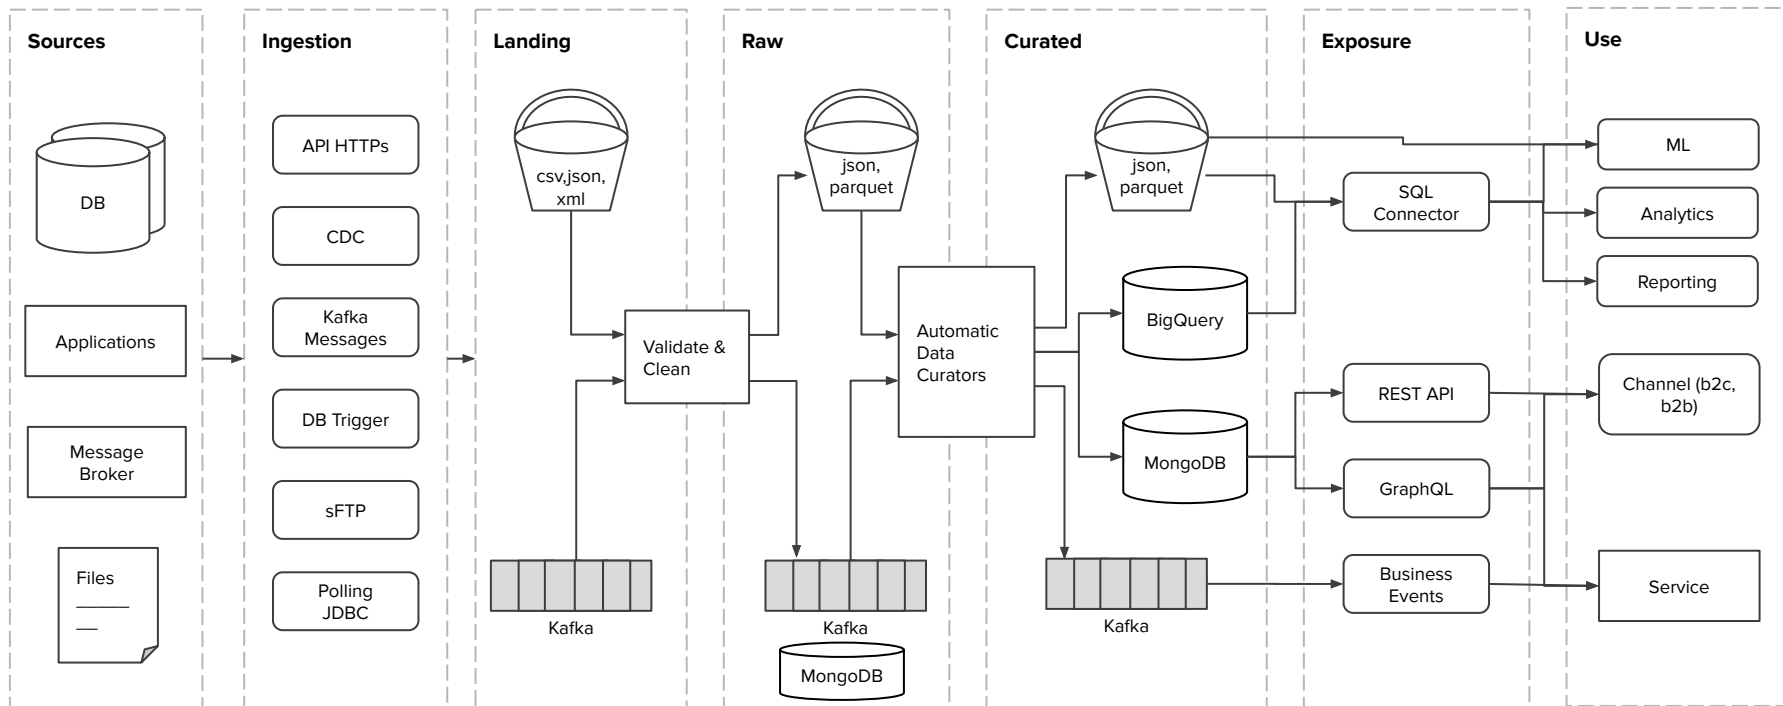

Ad alto livello è possibile catturare le informazioni in near real time e in polling dai vari sistemi con diverse soluzioni di ingestion. I dati catturati vanno su un'area di landing e sono raffinati in modo progressivo. I dati validati sono esposti ai vari canali per il loro uso.

L'approccio si chiama Data Mesh.

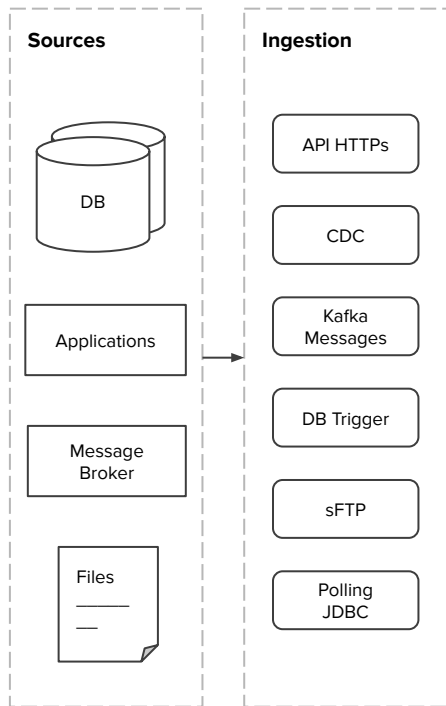

<https://martinfowler.com/articles/data-monolith-to-mesh.html>

# Visione Complessiva

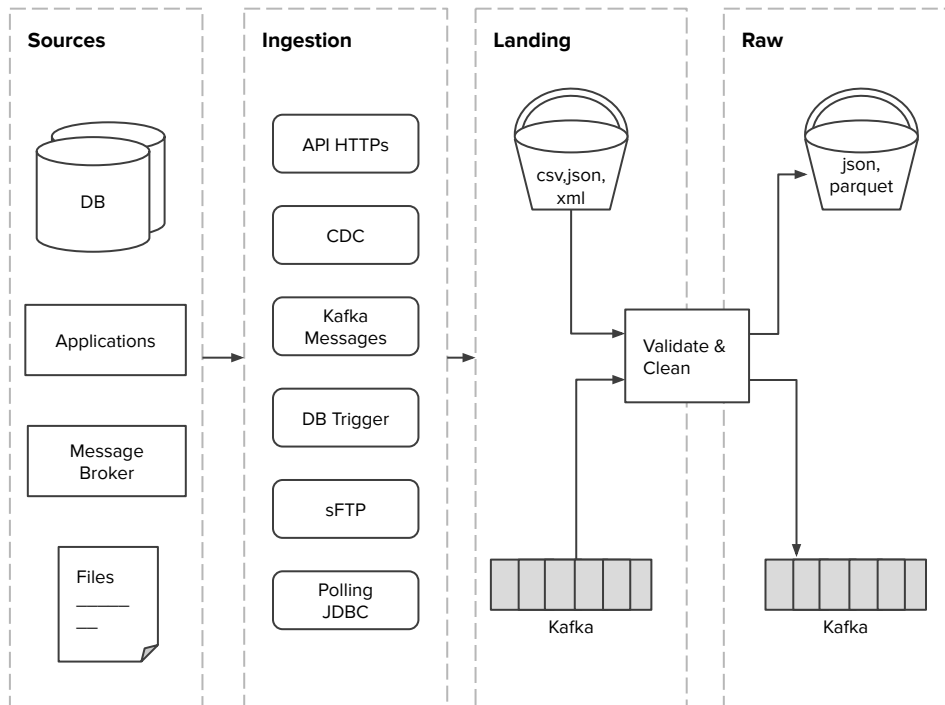

Le sorgenti dati sono eterogenee e hanno formati differenti del dato.

Una sorgente può essere catturata con diverse modalità di ingestion. Le modalità variano a seconda della velocità richiesta della cattura del cambiamento:

- **near realtime:** Change Data Capture (CDC), API in push, Kafka Messages, DB Triggers;
- **batch:** sFTP, Polling JDBC.

# Landing e Raw Data

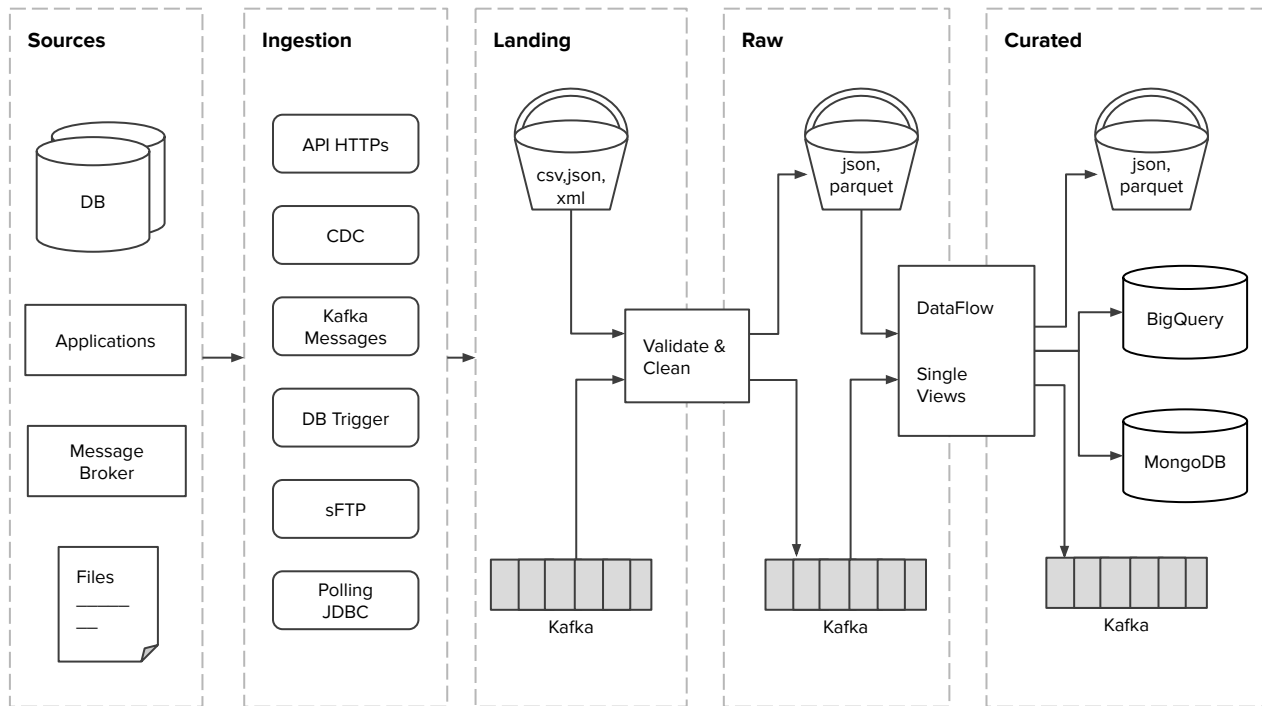

I dati che arrivano dalla ingestion sono depositati in prima istanza su due Data Store:

- **file bucket:** raccoglie file in diversi formati;
- **kafka:** raccoglie eventi

I dati che atterrano sull'area di landing sono validati e puliti e salvati su due data store grezzi.

Questa soluzione consente di far diventare file su bucket eventi e viceversa.

I file in raw sono pronti per essere lavorati.

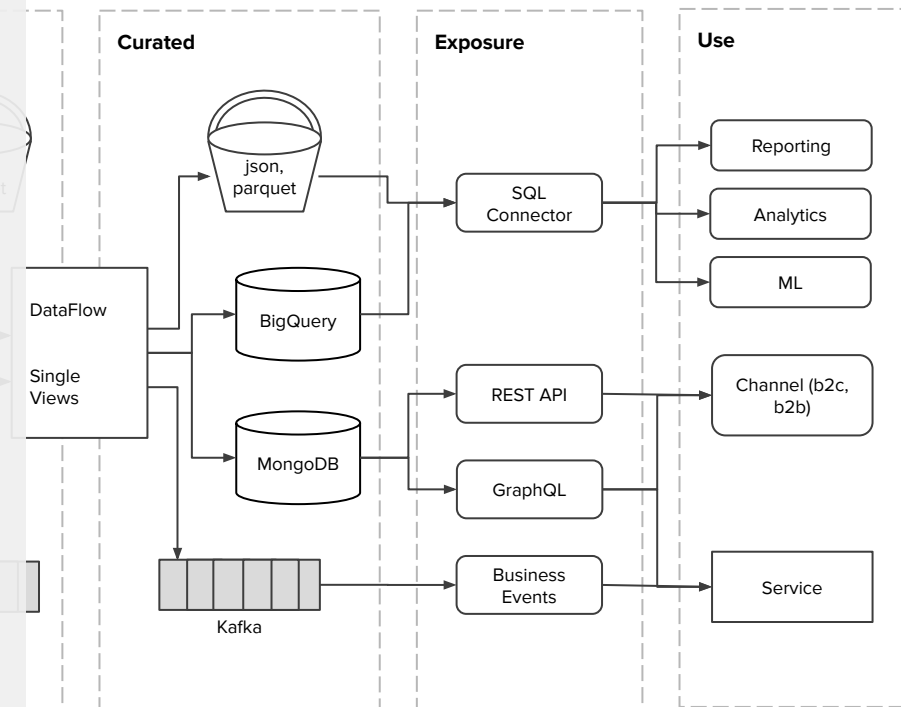

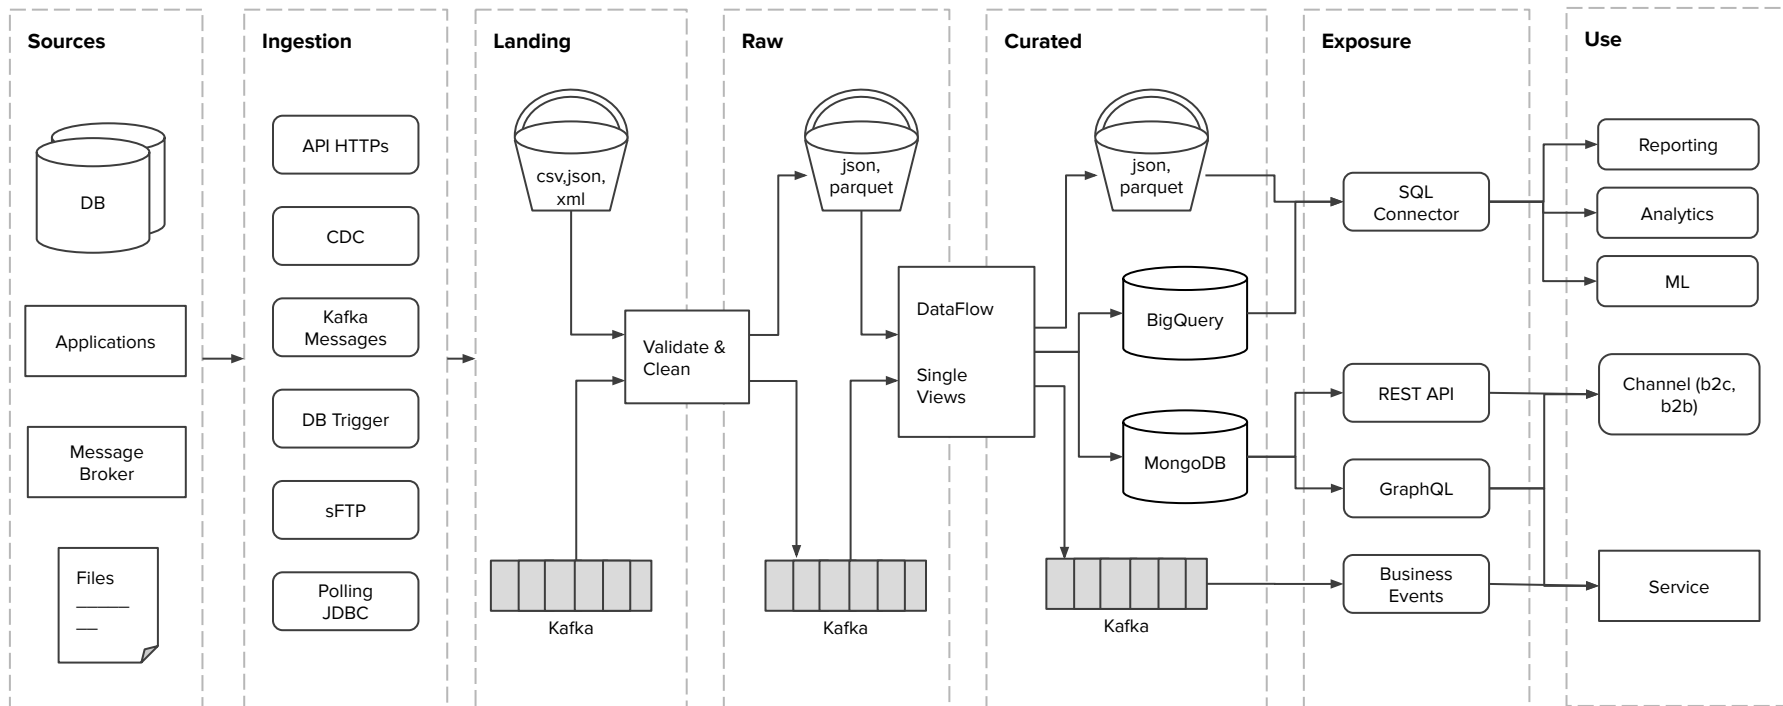

Da Raw è possibile creare 4 data store “curated” per scopo:

- **File Bucket:** per gestire grandi quantità di dato (terabytes) in modo uniforme ma non subito pronti per l’uso;
- **BigQuery:** per fare analisi e reporting;
- **MongoDB:** per servire i canali con Single Views pronte all’uso;
- **Kafka:** per eventi di dominio (esempio: il cliente ha speso i suoi punti fedeltà, il cliente ha aperto un reclamo).

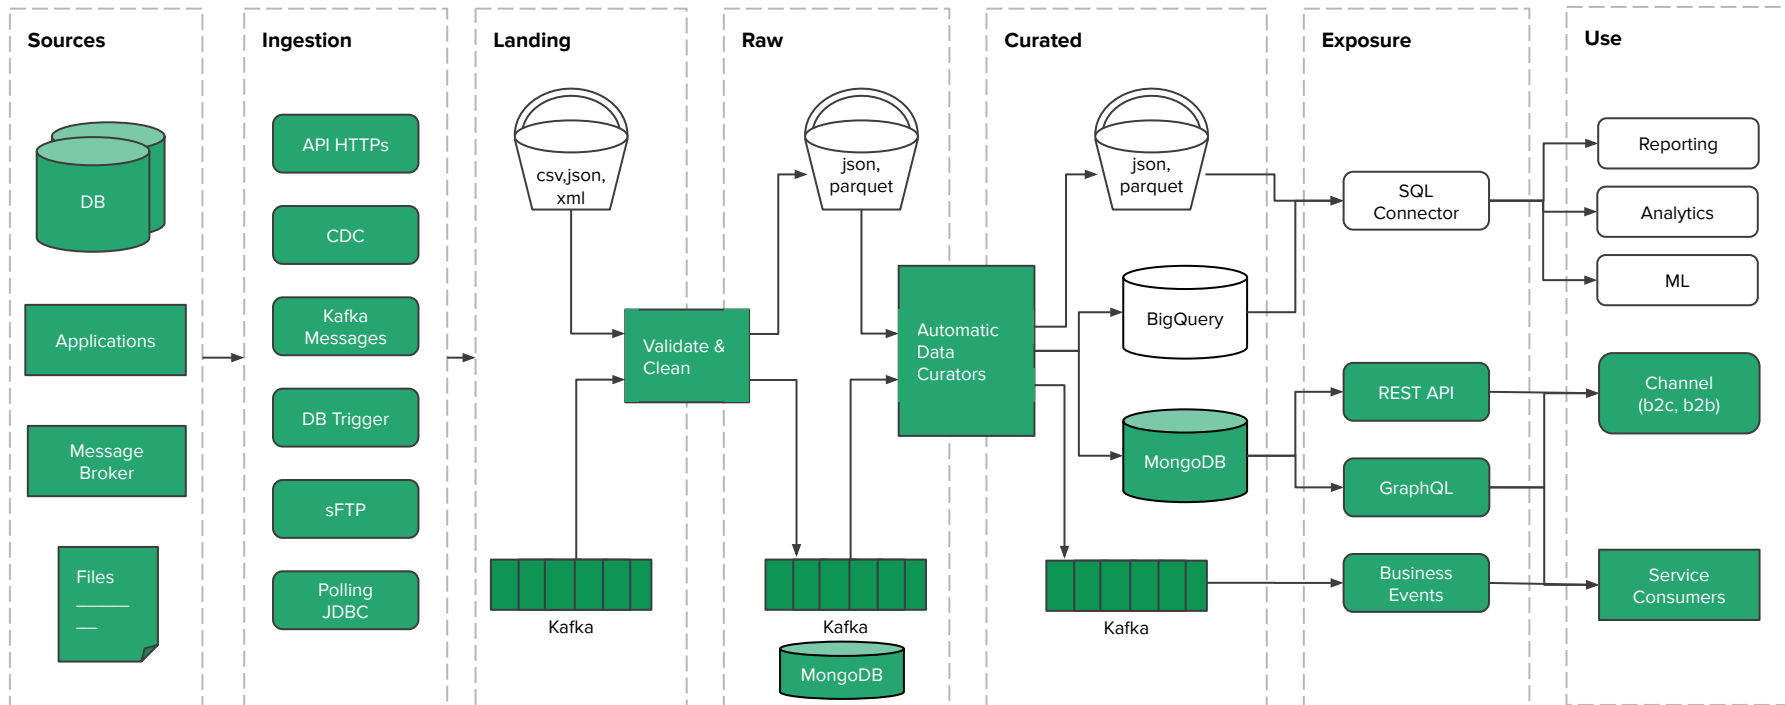

I dati sono esposti in diversi modi e fruibili con protocolli diversi a seconda dei consumatori:

- **SQL Connector:** consente di lavorare sui dati, comporre relazioni al bisogno. Ideale per Reporting statico, Analytics e Addestramento di Machine Learning (costo di composizione a richiesta);
- **Rest API:** fruibile ai vari canali (costo di composizione solo al cambiamento del dato e non alla chiamata singola);
- **Business Events:** fruibile da altri servizi/mini servizi/microservizi/saas (ogni evento di dominio è generato al cambiamento ed è consumato dai subscribers).

# Mia-Platform Data Mesh

Realtime data flow: da Sources a Curated < di 2 secondi. Query time < 50ms.

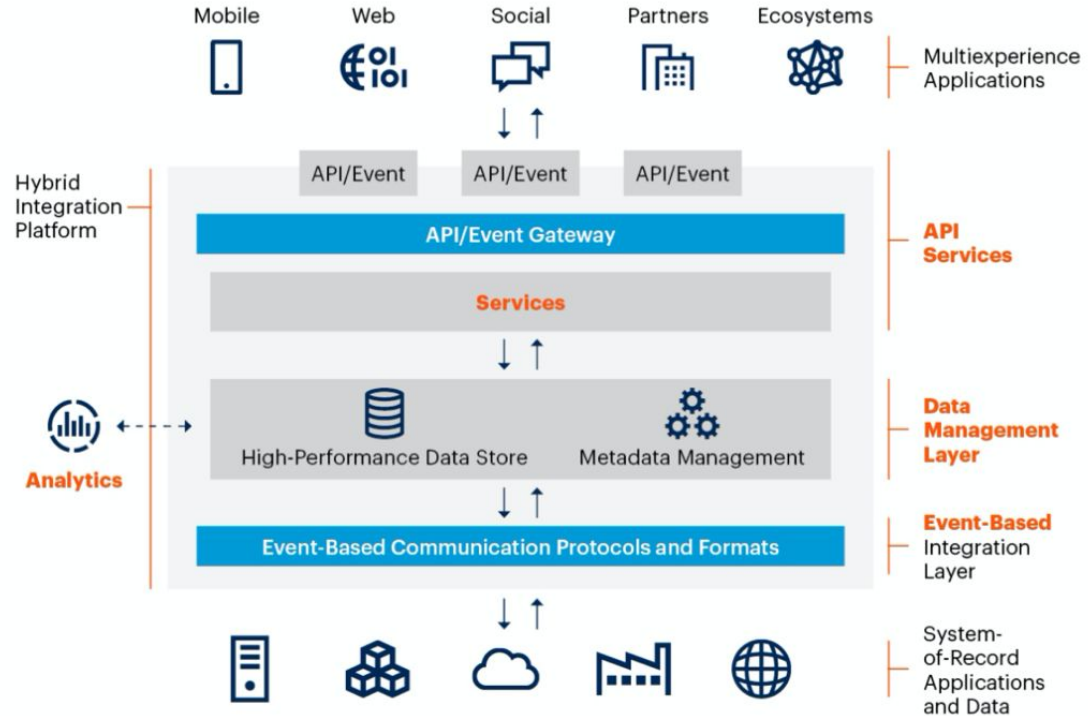

# Digital Integration Hub

# Gartner's Digital Integration Hub

*"As organizations move toward the composable enterprise, DIH-enabled API platforms will emerge as **key architectural foundations**, and deployments will become more comprehensive."*

Gartner, 'Innovation Insight: Turbocharge Your API Platform With A Digital Integration Hub', Massimo Pezzini, Eric Thoo, July 10, 2020

## API Services Access a Near-Real-Time Replica of Systems of Record Data

# Single View: the golden record of your business

Aggregate customers' relevant information into a **single view** that can be easily queried by your API's: this enables a **better user experience** across all the channels.

# Mia-Platform

## Digital Integration Hub

In the research report [Innovation Insight: Turbocharge Your API Platform With a Digital Integration Hub](#), Mia-Platform is named among the vendors for DIH-enabled API-platforms.

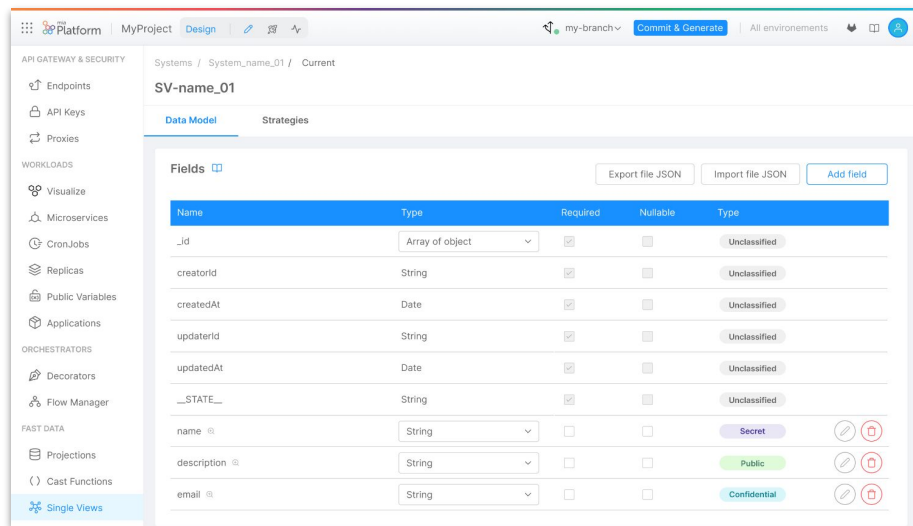

Gartner, 'Innovation Insight: Turbocharge Your API Platform With A Digital Integration Hub', Massimo Pezzini, Eric Thoo, July 10, 2020

DIH-enabled  
API Platform

Manage **real-time data streaming** and keep aligned your Systems of Record and your digital platform on Kubernetes.

- Decouple your **Systems of Record** reducing queries and access on data.
- Enjoy **data availability 24/7**, even when systems are offline for overnight maintenance.
- Scale your microservices effectively** according to business needs.
- Lock-out from your traditional systems and **be free to modernize** at will.

# Journey into DIH & Numbers

*“If we have data, let’s look at data. If all we have are opinions, let’s go with mine”*

**James L. Barksdale**

# Mia-Platform for Helvetia Assicurazioni

Read the case study

Mia-Platform

30

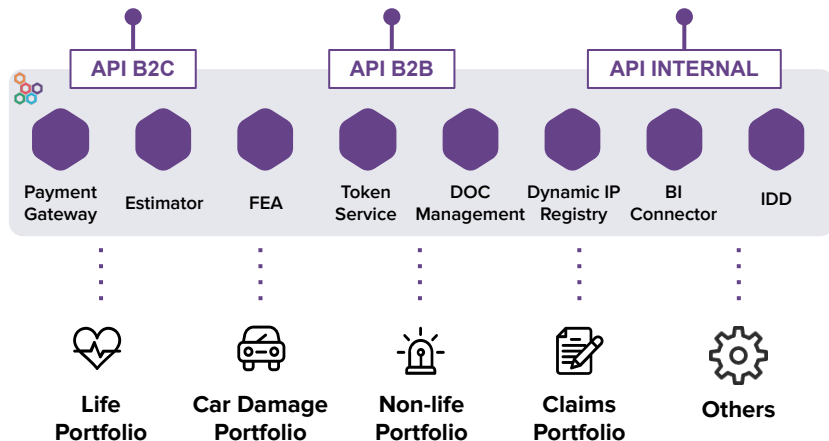

**Industry** Insurance  
**Country** Italy  
**Size** 500 empl., 60M €/y

## GOAL & NEEDS

Transform and improve development and release processes for new digital touchpoints implementing a Digital Integration Hub to simplify and speed up release of new insurance products. Offer a simple and responsive omnichannel UX for over 4 million customers.

## RESULTS & BENEFITS

Helvetia has been able to open 7 new business partnerships thanks to the easy access to data provided by its DIH-enabled API Platform.

-60%

Reduction in  
time-to-market

# Mia-Platform for Large Retailer

**Industry** Retail  
**Country** Italy  
**Size** 100+ stores, 2.3B €/y

## GOAL & NEEDS

Create a Digital Platform able to aggregate inventory data based on the needs of different businesses and serve different channels. Provide real-time data about inventory status to its applications.

## RESULTS & BENEFITS

Customer is now able to aggregate tables in one Single View, manage the history of the inventory and expose APIs to the channels in real time.

# POC in 4 weeks

Together with Intesys, our Certified Partner, we propose this incremental approach to accelerate the adoption and test the benefits of Mia-Platform Fast Data at minimum cost.

Week 1

## Business Definition

Define the need of the **Channel**

(eg. mobile app)

Week 2

## Data Model

Define the optimized data model

(eg. tax code)

Week 3

## Projection in Production

Find the data on the **legacy system** and do the connection

(e.g. database)

Week 4

## Finalization

Create the **Single View** and the **API** to expose the data

# Clients are enthusiastic about their gains

- ⬡ Banking & Finance
- ⬡ Healthcare
- ⬡ Mobility & Transportation
- ⬡ Insurance
- ⬡ Utility
- ⬡ Retail
- ⬡ Food & Beverage
- ⬡ Fashion & Luxury

*“Mia-Platform is the enabler of a new way of working, both operational and architectural...”*
